

# Electrostatic Potential Energy and Voltage (Electrostatic Potential)

homework:

- a) A balloon has a mass of 20.0 g and hangs from a 2.50 m string. If the charge on the balloon is  $3.0 \mu\text{C}$  and it gets deflected by 0.50m what is the electric field strength?

$$E = \frac{F_e}{q}$$

$$F_e = F_g \tan \theta$$

$$\underline{E q} = mg \tan \theta$$

$$E = \frac{(0.020 \text{ kg})(9.80 \frac{\text{N}}{\text{kg}}) \tan 11.5^\circ}{3.0 \times 10^{-6} \text{ C}}$$

$$E = 1.3 \times 10^5 \frac{\text{N}}{\text{C}}$$

A  $2\ \mu\text{C}$  and  $4\ \mu\text{C}$  charge are  $20\text{cm}$  apart.  
 what is the electric field strength  $5.0\text{cm}$   
 above the midpoint? (need cosine law)

$$E_1 = \frac{9 \times 10^9 \cdot 4 \times 10^{-6}}{0.1^2 + 0.05^2}$$

$$E_2 = \frac{9 \times 10^9 \cdot 2 \times 10^{-6}}{0.1^2 + 0.05^2}$$

$$E_1 = 2.88 \times 10^6 \frac{\text{N}}{\text{C}}$$

$$E_2 = 1.44 \times 10^6 \frac{\text{N}}{\text{C}}$$

$$E^2 = E_1^2 + E_2^2 - 2E_1E_2\cos 2\theta$$

$$\theta = \tan^{-1} \frac{0.05}{0.1} = 26.57^\circ$$

$$E = 2.32 \times 10^6 \frac{N}{C}$$

Electrostatic Energy,  $E_e$  and Voltage (Electrostatic Potential),  $V$ .

Recall gravity

Uniform field	General
$E_g = mgh$ if $g$ is uniform like near Earth	$E_g = -GMm/r$ use if $g$ is not uniform, like around any planet star

What's your guess about electrostatics

Uniform Field	Point Charge
$\Delta E_e = -qEd$ $d$ in the direction of $E$	$E_e = kQq/r$ relative to zero at $r$ approaches infinity

derive these equations from

$$W = Fd = qEd$$

$$\text{or } W = \text{integral of } Fdr = kQq/r$$

eg.

1. Millikan is famous for determining the charge of an electron by levitating oil droplets into a uniform electric field. Say a 0.20g oil drop has 5 electrons ( $q = 1.602 \times 10^{-19} \text{C}$  each), what electric field strength would be required for levitation?

$$mg = Eq \quad E = \frac{0.0002(9.8)}{5(1.602 \times 10^{-19})}$$
$$E = 2.45 \times 10^{15} \frac{\text{V}}{\text{C}}$$

1. What is the electrostatic energy of the electron in a hydrogen atom, radius  $5.0 \times 10^{-11} \text{m}$ ?

$$E_e = \frac{k q_1 q_2}{r} = \frac{9 \times 10^9 (1.602 \times 10^{-19})(1.602 \times 10^{-19})}{5 \times 10^{-11}}$$

$$E_e = -4.4 \times 10^{-18} \text{ J}$$

relative to zero at  $r \rightarrow \infty$

## Electrostatic Potential - Voltage

is the energy per unit charge

$$V = E_e / q$$

uniform field, or  $E$  given,

$$\Delta V = -qEd / q = -\underline{Ed}$$

if  $d$  is in the direction of the electric field,  $E$

around a point charge,  $Q$

$$V = kQ/r \text{ relative to zero at infinity}$$

units: Volt,  $V = J/C$

eg. You put a 9.0 V battery across two parallel plates, 4.0 mm apart to produce an electric field.

- what is the magnitude of the electric field?
- You accelerate an electron through a potential of 700V, what is the i) kinetic energy of the electron? ii) velocity?
- keeners: the electron from b goes into the electric field from a, perpendicular to  $E$ . What is the force on the electron? if the plates are 12 cm long, how far is the electron deflected from its original path?

Homework - do this question and practice test test Friday

Quiz

Q1

$$F_{up} = F_{down}$$

$$2F_t \sin \theta = F_g$$

$$2 \times 250 \times \sin(35) = 286.788218175523 = 2.9 \times 10^2 \text{ N}$$

$$2 \times 250 \times \sin(45) = 353.5533905932737 = 3.5 \times 10^2 \text{ N}$$

$$2 \times 250 \times \sin(55) = 409.5760221444959 = 4.1 \times 10^2 \text{ N}$$

2a)

$$\tau_c = \tau_{cc}$$

$$m_1 g L / 2 + m_2 g L = F_t \sin 30 L$$

$$F_t = ((600/2) + (1500)) / (\sin(30)) = 3600 \text{ N}$$

$$= ((900/2) + (1500)) / (\sin(30)) = 3900 \text{ N}$$

$$= ((1100/2) + (1500)) / (\sin(30)) = 4100 \text{ N}$$

b)  $F_x = F_t \cos \theta$  is compression

$$3600.0 \times \cos(30) = 3117.69145362398 = 3.1 \text{ kN}$$

$$3900.0 \times \cos(30) = 3377.499074759311 = 3.4 \text{ kN}$$

$$4100.0 \times \cos(30) = 3550.704155516199 = 3.6 \text{ kN}$$

3.

$$\tau_c = \tau_{cc}$$

$$m_1 g r_1 + m_2 g r_2 = F_b L$$

$$F_b = ((50 \times 9.8 \times 4) + (65 \times 9.8 \times 5)) / 8 = 643 \text{ N}$$

$$((30 \times 9.8 \times 4) + (65 \times 9.8 \times 5)) / 8 = 545 \text{ N}$$

$$((50 \times 9.8 \times 4) + (85 \times 9.8 \times 5)) / 8 = 766 \text{ N}$$

$$F_a = f_{down} - f_{up}$$

$$= (50 \times 9.8 + 65 \times 9.8) - 643 = 484 \text{ N}$$

$$= (30 \times 9.8 + 65 \times 9.8) - 545 = 386 \text{ N}$$

$$= (50 \times 9.8 + 85 \times 9.8) - 766 = 557 \text{ N}$$

a) increase

$$\tau_c = \tau_{cc}$$

$$m_1 g r_1 \sin \alpha + m_2 g r_2 \sin \alpha = F_b L \sin \theta$$

$$((20 \times 9.8 \times 2 \times \sin(30)) + (75 \times 9.8 \times 3 \times \sin(30))) / (4 \times \sin(60)) = 375 \text{ N or } 410 \text{ N or } 350 \text{ N}$$

$$b) F = \sqrt{F_f^2 + F_N^2} = \sqrt{375^2 + (95 \times 9.8)^2} = 1.0 \text{ kN or } 1.1 \text{ kN or } 1.0 \text{ kN}$$

p438

Q28

$E = 3.0 \times 10^4 \text{ N/C}$  uniform in parallel plates

$d = 1.6 \text{ cm}$

$v = ?$

$m = 9.11 \times 10^{-31} \text{ kg}$

$q = 1.602 \times 10^{-19} \text{ C}$

$$E = F/q \quad F = ma \quad a = Eq/m \quad v_f^2 = v_i^2 + 2ad$$

$$\text{or } W = Fd = \Delta E_k$$

$$Eqd = \frac{1}{2}mv^2$$

$$v = \sqrt{2Eqd/m} = \sqrt{2(3 \times 10^4)(1.6 \times 10^{-19}) / (9.11 \times 10^{-31})}$$

$$v = \sqrt{2 \times 3 \times 1.6 \times 0.016 / 9.11} = 0.12984834521554 \times 10^7 \text{ m/s}$$

Electrostatic Potential energy,  $E_e$  and

Electrostatic Potential,  $V$  or Voltage

They are not the same thing!

1. Millikan is famous for determining the charge of an electron by levitating oil droplets into a uniform electric field. Say a 0.20g oil drop has 5 electrons ( $q=1.602 \times 10^{-19}\text{C}$  each), what electric field strength would be required for levitation? If the electrons jump off the oil drop, what is the work done on the electrons if they move 1.0 cm in the direction of the field?
2. What is the electrostatic energy of the electron in a hydrogen atom, radius  $5.0 \times 10^{-11}\text{m}$ , relative to zero at infinity?

1.  **$F_g = F_e$**   
 **$mg = Eq$**

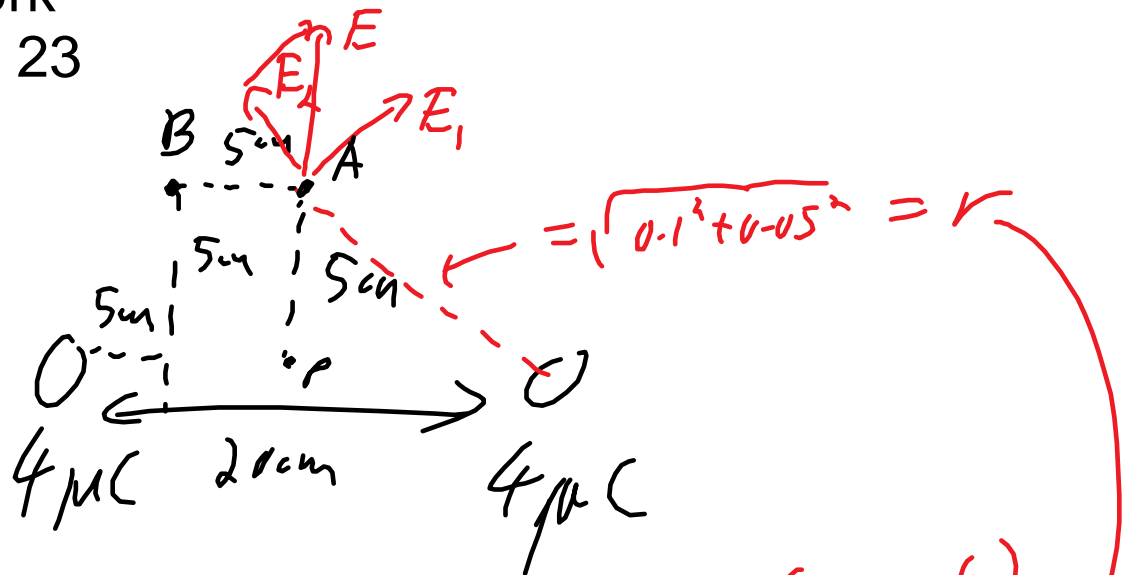

$$E = mg/q = 0.0002 \times 9.8 / (5 \times 1.602 \times 10^{-19}) = 2.4 \times 10^{15} \text{N/C}$$

$$W = qEd = 5 \times 1.602 \times 10^{-19} \times 2.4 \times 10^{15} \times 0.01 = 2.0 \times 10^{-5} \text{J}$$

2.

$$E_e = kQq/r = 9 \times 10^9 \times 1.602 \times 10^{-19} \times (-1.602 \times 10^{-19}) / 5 \times 10^{-11} = -4.6 \times 10^{-18} \text{J}$$

# Homework Q19 and 23

$$E_1 = \frac{kq}{r^2} = \frac{9 \times 10^9 (4 \times 10^{-6})}{(0.1^2 + 0.05^2)}$$

$$= 2.88 \times 10^6 \frac{\text{N}}{\text{C}}$$

$$\theta = \tan^{-1} \frac{5}{10} = 26.57^\circ$$

$$E = 2 (\sin 26.57) 2.88 \times 10^6 \frac{\text{N}}{\text{C}}$$

$$= 2.58 \times 10^6 \frac{\text{N}}{\text{C}} \quad \underline{\text{up}}$$

b)

$$\tan^{-1} \frac{5}{15} = 18.43^\circ$$

$$E^2 = E_1^2 + E_2^2 - 2E_1E_2 \cos \theta$$

$\theta = 63.43^\circ$

$$E_1 = \frac{kQ}{r} = \frac{9 \times 10^9 (4 \times 10^{-6})}{0.05^2 + 0.15^2} = 1.44 \times 10^6 \frac{N}{C}$$

$$E_2 = \frac{9 \times 10^9 (4 \times 10^{-6})}{0.05^2 + 0.05^2} = 7.2 \times 10^6 \frac{N}{C}$$

$$E^2 = 1.44^2 + 7.2^2 - 2(1.44)(7.2) \cos 63.4^\circ$$

$$E = 7.9 \times 10^6 \frac{N}{C}$$

$$6.64 \times 10^6 \frac{N}{C}$$

$$\sin \phi = \frac{\sin 63.4^\circ}{1.44}$$

$$\frac{7.2}{6.68} = \frac{11.4}{6.68}$$

$$\phi = 74.5^\circ$$

towards A

Q 23

$$\tan \theta = \frac{x}{y}$$

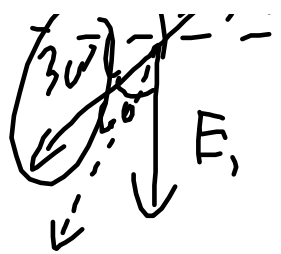

$$x = \frac{l}{2} \tan 30$$

$$x = \frac{l}{2\sqrt{3}}, \quad y = \frac{l}{2}$$

$$E = 2 \frac{kQ}{r} \cos 30$$

$$E = 2 \frac{F \cos 30}{l}$$
